

Assignment – Create an ASP.NET MVC Ecommerce Site to Sell Laptops

- A database was created – Laptops
- Three tables are added
 - Gaming Laptops
 - Business Laptops
 - Thin and Light Laptops
- Each of these tables have – ID, Name, Description and Price.
- ASP.NET MVC application is created using the basic template.
- Here we take a DbFirst Approach as the database has already been created.
- We choose the ADO.NET – Entity framework model template to create the model class for our database.
- Then we create Controllers for the tables using the model classes we just created, and CRUD operation methods are created too.
